NeXoN (NXN) — PRO Whitepaper

Telegram Mini App Game on TON • Product, Economy, Systems and Current Live Features

Version: Current live build
Language: English
Prepared for website publication

What this document covers

This whitepaper reflects the current live gameplay and backend logic shared in the project files.
It focuses on real systems already implemented or clearly exposed in the product UI.
NFT boosts are not included. The in-game Shop is the active upgrade layer.

1. Executive Summary

NeXoN is a Telegram-native mini app built around fast session gameplay, competitive progression and cyclical reward mechanics. The product combines a tap-based core loop with energy management, direct player-to-player competition, referral growth, task-based onboarding, daily retention rewards, staking events and TON-powered premium boosts.

The design goal is simple: make NXN feel alive every day. Players can tap, upgrade, compete, transfer value, invite others, climb leaderboards and position themselves for periodic reward events without leaving Telegram. This creates a compact game loop with short sessions, visible progression and multiple reasons to return.

---

2. Product Vision

NeXoN is designed as a social-first, mobile-native game economy rather than a passive token page. The product is optimized for Telegram distribution, fast onboarding and repeated engagement. Instead of relying on a single activity, NeXoN layers several loops together:

- Immediate loop: tap to earn NXN, manage energy and watch balance grow.
- Daily loop: claim rewards, keep streak momentum and unlock milestone boosts.
- Competitive loop: enter PvP matches and leaderboard races.
- Event loop: burn NXN into the reward event and compete for ranking-based payouts.
- Growth loop: invite players, build referral stack and bring external traffic into the economy.
- Monetization loop: buy premium boosts through TON via TonConnect.

---

3. Current Live Feature Set

The current product surface includes the following live areas and systems:

- Home / Tap screen with live NXN balance and energy bar.
- Leaderboard with Top 100 ranking and highlighted self-positioning.
- Games section with PvP Arena live and Jackpot Rush marked as coming soon.
- Stake screen with reward-cycle participation, rank competition and claim flow.
- Daily reward screen with 28-day progression.
- Tasks screen with Telegram and X tasks.
- Referral screen with bind code, stats and referral stack balance.
- Transfer screen with peer-to-peer transfers by Telegram ID.
- Shop with permanent upgrades bought in NXN and timed boosts bought in TON.
- TON wallet connection through TonConnect.

---

4. Core Gameplay Loop

The primary gameplay loop begins on the Tap screen. Players earn NXN by tapping the main coin. Each tap consumes energy, and energy automatically regenerates over time. This keeps sessions quick and repeatable while also making upgrades meaningful.

Loop Stage	Player Action	Game Outcome
Tap	Tap the main coin	Earn NXN and reduce energy
Recover	Wait for regeneration	Energy gradually refills
Upgrade	Use NXN or TON in Shop	Increase earning power or efficiency
Compete	Enter PvP or Stake event	Convert progression into rank pressure
Return	Claim daily/task/referral rewards	Reinforce retention and growth

5. Economy Overview

NXN acts as the main in-game unit. It is earned through gameplay and distributed through reward systems, then cycled back into sinks such as staking, PvP participation, upgrades and transfer burn. The economy is structured around both issuance and removal.

Main NXN Sources

Tap earnings from core gameplay
Daily reward system
Task rewards
Reward event payouts
Referral-related earnings

Main NXN Sinks

Reward event staking (burned after confirmation)
PvP stake-based entry pressure
Transfer fee burn (10%)
Permanent shop upgrades purchased in NXN

6. Energy System

Energy is the pacing layer for the tap loop. Players cannot tap indefinitely; instead, the system encourages repeated daily sessions. In the backend, energy regenerates continuously and the displayed maximum can be expanded through upgrades and timed boosts.

- Base max energy exists for every player.
- Permanent NXN purchase: Energy +100.
- Timed TON boost: Energy +300 for 30 days.
- Daily reward milestone: Energy +200 for 24 hours.

---

7. Shop and Upgrade Model

NeXoN uses a live Shop rather than an NFT-based upgrade system. This keeps the product simple, readable and easy to operate inside Telegram. The Shop currently contains both permanent upgrades priced in NXN and timed premium boosts priced in TON.

Item	Type	Price	Effect
Tap Power +1	Permanent	30,000 NXN	Raises base tap output by +1
Energy +100	Permanent	50,000 NXN	Raises base max energy by +100
Tap Power +3	Timed	0.2 TON	Adds +3 tap power for 30 days
Energy +300	Timed	0.5 TON	Adds +300 max energy for 30 days
Autoclicker	Timed	1 TON	Generates NXN passively for 30 days

The Shop is important because it links progression, retention and monetization in one place. Permanent NXN upgrades create long-term goals for active players, while TON boosts provide a premium path for users who want faster momentum.

8. Autoclicker System

Autoclicker is a timed premium boost purchased via TON. When active, it continues generating NXN while the player is away. This improves retention and reduces the penalty of being offline.

- Autoclicker duration in the current implementation: 30 days.
- Offline generation is processed periodically on the backend.
- The daily reward track also includes a shorter Autoclicker milestone reward for 10 hours.

9. PvP Arena

PvP Arena is the live competitive game mode inside the Games section. Players choose a stake amount, enter the arena and compete in a short real-time tapping battle. This adds direct skill pressure, social challenge and a faster emotional loop than passive balance growth.

PvP Attribute	Current Design
Mode	1 vs 1 real-time match
Match length	20 seconds
Entry structure	Stake-based
Visible stake options	1K, 5K, 10K, 20K, 30K, 40K, 50K, 100K NXN
UI status	Live
Home card note	Burn 10%

The PvP system is built to be fast, readable and repeatable. It also supports invites, online presence and match countdown flow, which makes it suitable for community-driven activity and social content around direct challenges.

10. Leaderboard System

NeXoN includes a Top 100 leaderboard sorted by player balance. The leaderboard gives players a persistent ranking target outside of individual events. It also highlights the current user when they appear in the visible range, reinforcing status and competition.

- Top 1, Top 2 and Top 3 receive premium visual treatment in the UI.
- The remaining Top 100 list remains visible in a scrollable ranking table.
- The user's own row is highlighted when present.

---

11. Reward Event System

The Reward Event is the central competitive sink in the economy. Players commit NXN during the live staking phase, which removes that NXN from active circulation. Once the stake phase closes, eligible players can claim fixed rewards during the claim phase based on final ranking.

Event Parameter	Current Value
Stake phase length	7 days
Claim phase length	2 days
Cycle total length	9 days
Configured reward pool total	240,000 NXN
Eligibility window	Top 100 only
Claim requirement	TON wallet submission

The event turns accumulated NXN into a deliberate strategic choice. Players can keep NXN liquid, spend it on upgrades, use it in PvP, transfer it or burn it into the event for leaderboard placement. This creates a strong risk-reward layer.

12. Reward Event Payout Structure

The current backend logic uses a fixed payout structure for the Top 100 ranks. These rewards add up to the full 240,000 NXN cycle pool.

Rank Range	Reward per Player	Players	Total Allocation
1–10	6,000 NXN	10	60,000 NXN
11–40	3,000 NXN	30	90,000 NXN
41–70	2,000 NXN	30	60,000 NXN
71–100	1,000 NXN	30	30,000 NXN

Important event rules

Minimum regular event stake: 10,000 NXN.
Staked NXN is burned after confirmation.
Only Top 100 ranks are eligible to claim.
Claims require a TON wallet address during the claim window.

13. Referral System

The referral system is more than a simple invite counter. It includes referral codes, binding logic, referral-specific balances and a dedicated use case inside the reward event.

- Each user receives a referral code.
- A new user can bind another player's code once.
- Both inviter and invited user receive 50,000 NXN in referral stack balance after a valid bind.
- Referral stack balance is separate from normal NXN balance.
- Referral stack can be used only for reward-event staking.

This structure is important because it channels social growth directly into the event economy. Instead of only creating a cosmetic invite number, referrals produce meaningful event capacity.

14. Referral Metrics

The referral screen exposes the following live metrics:

- Invited count
- Active referrals
- Total earned
- Referral stack balance

15. Task System

The task system is a lightweight acquisition and re-engagement layer. It currently includes Telegram and X tasks.

Task	Action	Current Reward
Telegram task	Join the official Telegram channel and verify	5,000 NXN
X task	Follow the official X account	5,000 NXN

In the present implementation, the Telegram task includes verification logic tied to subscription checks. The X task currently grants reward through the in-app flow without external verification complexity.

16. Daily Reward System

The Daily Reward screen uses a 28-day progression structure. It mixes small NXN distributions with milestone boosts so that the player experience does not feel flat. This system is built for retention and routine.

Day Milestones	Reward Type	Current Reward
Day 1	NXN	500 NXN
Day 6	Boost	Tap +2 for 24h
Day 12	Boost	Energy +200 for 24h
Day 16 / 20 / 24	NXN milestone	2,000 NXN
Day 28	Boost	Autoclicker for 10h

Between the milestone days, the system continues to deliver smaller NXN rewards such as 750, 1,000, 1,250 and 1,500 NXN, creating a smooth progression curve rather than a single weekly spike.

17. Transfer System

Players can transfer NXN directly to another user by Telegram ID. This makes NeXoN more social and more flexible than a closed single-player loop.

- Minimum transfer: 100 NXN.
- Transfer fee: 10% burn.
- Both sent and received amounts are stored in history.
- Transfer history is viewable in the app.

The transfer burn is a meaningful sink because it introduces friction while still allowing direct user-to-user movement of value.

---

18. TON Integration

NeXoN supports wallet interaction through TonConnect. TON is currently used for premium purchases in the Shop. This lets the project monetize without forcing the core loop to depend entirely on paid access.

- Tap Power +3 boost: 0.2 TON
- Energy +300 boost: 0.5 TON
- Autoclicker 30-day boost: 1 TON

TON integration also supports reward-event claims by requiring a TON wallet submission during the claim phase.

---

19. Session Design and Retention Logic

The game is structured around repeated short sessions rather than long mandatory play. This fits Telegram behavior and improves daily return probability.

- Tap loop supports fast micro-sessions.
- Energy gating creates natural comeback timing.
- Daily rewards create habit pressure.
- Tasks create early onboarding motivation.
- Stake events create medium-term strategy pressure.
- PvP creates emotional spikes and social competition.

---

20. Current Content Status

The current live content state, based on the shared interface and routes, can be summarized as follows:

System	Status
Tap loop	Live
Leaderboard	Live
Reward Event	Live
Claim flow	Live
Referral system	Live
Daily rewards	Live
Tasks	Live
Shop	Live
PvP Arena	Live
Jackpot Rush	Coming soon

21. Why the Model Can Scale

NeXoN has an advantage as a Telegram-native game because onboarding is lightweight and the product loop is easy to understand. The game does not rely on one complex mechanic; it stacks multiple simple systems together. This usually scales better in mini app environments because players can discover value gradually.

- Simple entry: tap immediately on the first session.
- Visible progression: balance, energy, ranking, selected stake.
- Social spread: invite system and direct PvP challenge behavior.
- Value sinks: staking, PvP pressure, transfer burn, upgrade spending.
- Monetization: TON boosts without blocking free players completely.

---

22. Strategic Direction

The current product is already positioned for expansion. The foundation supports new competitive modes, more task integrations, more event variants and stronger community loops without breaking the base economy.

- Expand game modes beyond PvP Arena.
- Deepen event logic and seasonal competition.
- Broaden traffic acquisition through social tasks and creator campaigns.
- Introduce richer progression layers while preserving fast onboarding.
- Keep the economy readable: simple sources, visible sinks and clear reward rules.

- ## 23. Conclusion

NeXoN is not just a tap screen. It is a layered Telegram mini app economy with live retention systems, competitive ranking logic, referral-driven growth, premium TON monetization and a recurring burn-based reward event. The current build already contains enough depth to operate as a serious product foundation, while still being compact enough for fast user adoption inside Telegram.

Appendix A — Exact Live Reward References

System	Live Rule
Task rewards	Telegram +5,000 NXN / X +5,000 NXN
Subscription bonus	3,000 NXN one-time bonus
Referral bind	50,000 referral-stack NXN to inviter and invited user
Referral stake minimum	10,000 NXN
Regular stake minimum	10,000 NXN
Transfer minimum	100 NXN
Transfer burn	10%
Reward event pool	240,000 NXN

Appendix B — Publication Note

This document is written for public website presentation. It is designed to explain the current live product and economy clearly, without describing removed systems such as NFT boosts. The active premium layer is the in-game Shop.
